

Microsoft®

**Windows.net™**

Server Family

# **AWS305: IIS 6.0 Rearchitecture and Reliability**

**Jeff Kercher  
IIS6 Program Manager  
Microsoft Corporation**

# Agenda

- **Rearchitecting IIS for Reliability**
- **Application Pooling**
- **Recycling**
- **Health Detection**
- **Application Tips**
- **Resources**
- **Q/A**

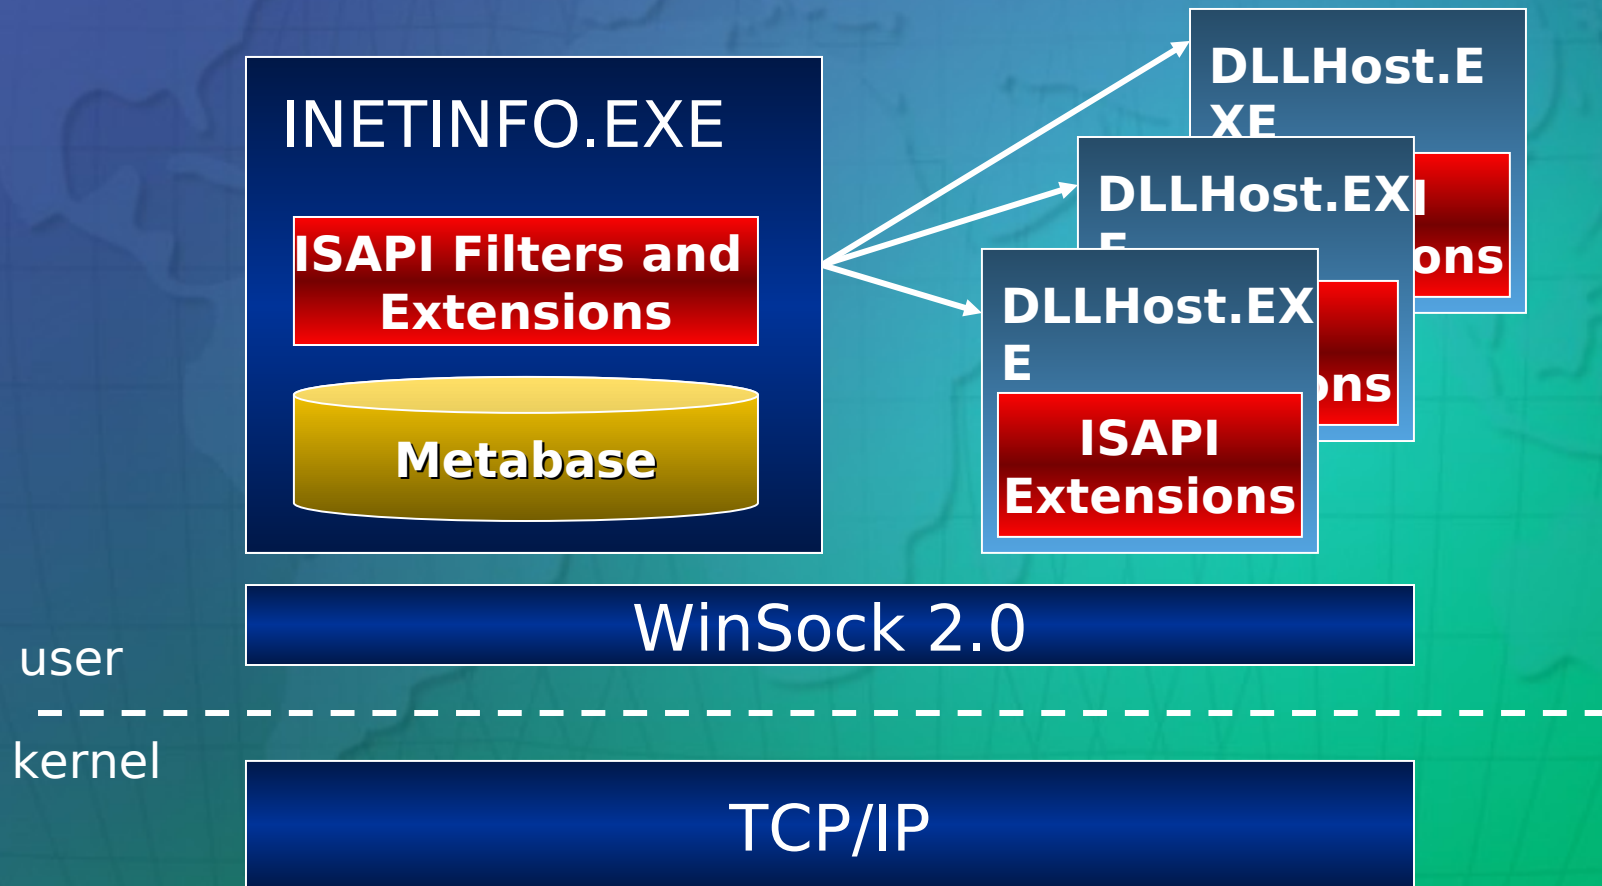

# **Rearchitecting IIS**

## **Why do it - Current Challenges**

- **Availability - need 99.999% uptime**
  - **Apps can still run in INETINFO on IIS5, which can affect web server reliability**
- **App isolation comes at a cost**
  - **Perf vs. Reliability**
  - **Can't isolate everything!**
- **IISRESET = Heavy Hammer**
  - **Resets connections**

# Rearchitecting IIS

## A review of IIS5

# Rearchitecting IIS

## A New Architecture for IIS6

- **GOAL: enable complete app isolation from other web apps and core web server**
- **Web service in INETINFO split out to do this:**
  - **HTTP.SYS: kernel mode listener and request router**
  - **WAS: config and process manager**
  - **Web Processing Core: where web apps are processed**

# Researchitecting IIS

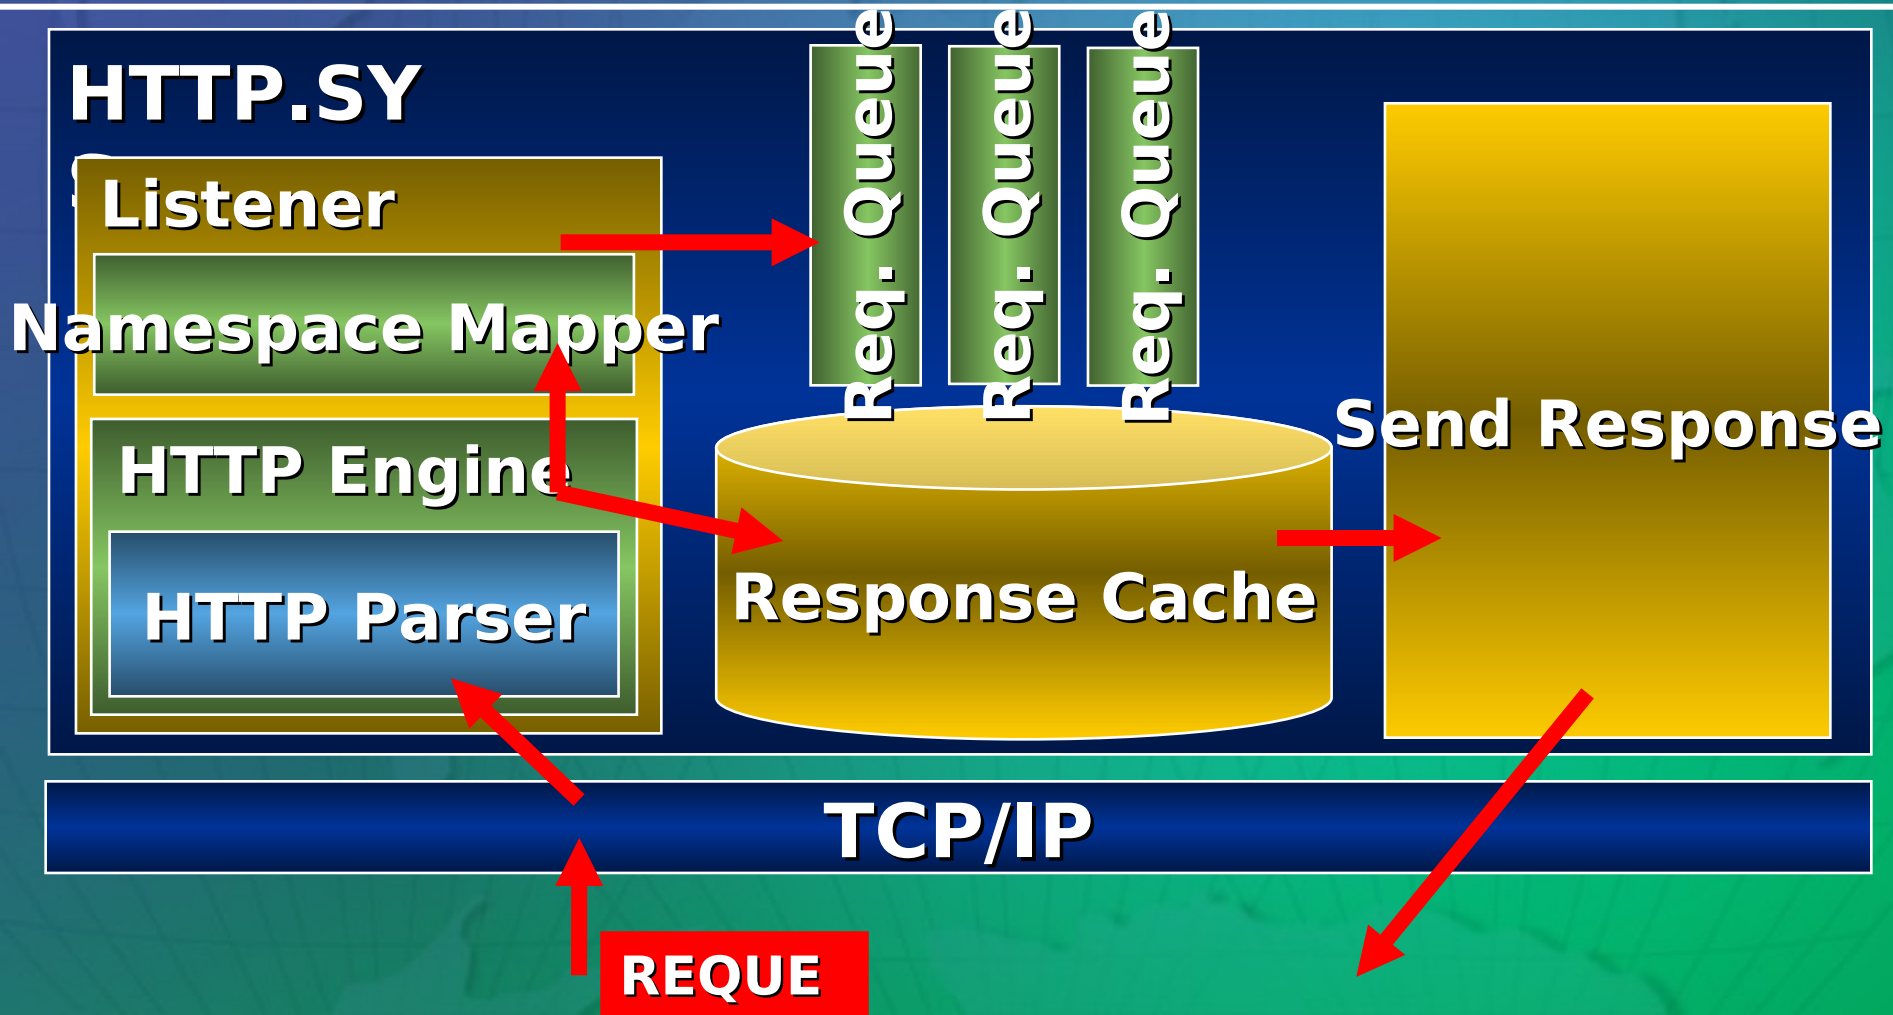

## HTTP.SYS

- **What is it?**
  - Kernel-mode HTTP stack/listener
  - *Always* running
  - Supports listening on IPv4 and IPv6 protocols
- **Reliability Features**
  - Doesn't load or run any web apps including ISAPI filters and extensions
  - Process routing based on URL
  - Request queues: kernel-mode queuing
- **Performance Features**
  - Kernel-mode response cache
  - Text-based and binary logging

# Rearchitecting IIS

## HTTP.SYS Internals

### HTTP.SYS API

# **Researchitecting IIS**

## **Web Admin Service (WAS)**

- **Application Manager**
  - **Manages lifetime of W3 Core(s)**
- **Configuration Manager**
  - **Configures *HTTP.SYS***
- **No application code**
  - **Ensures web server reliability**
  - **External monitor of web application processes**
  - **Ensures web application and service reliability**
- **Hosted in SVCHOST.exe**
  - **Actually part of W3SVC**

# **Rearchitecting IIS**

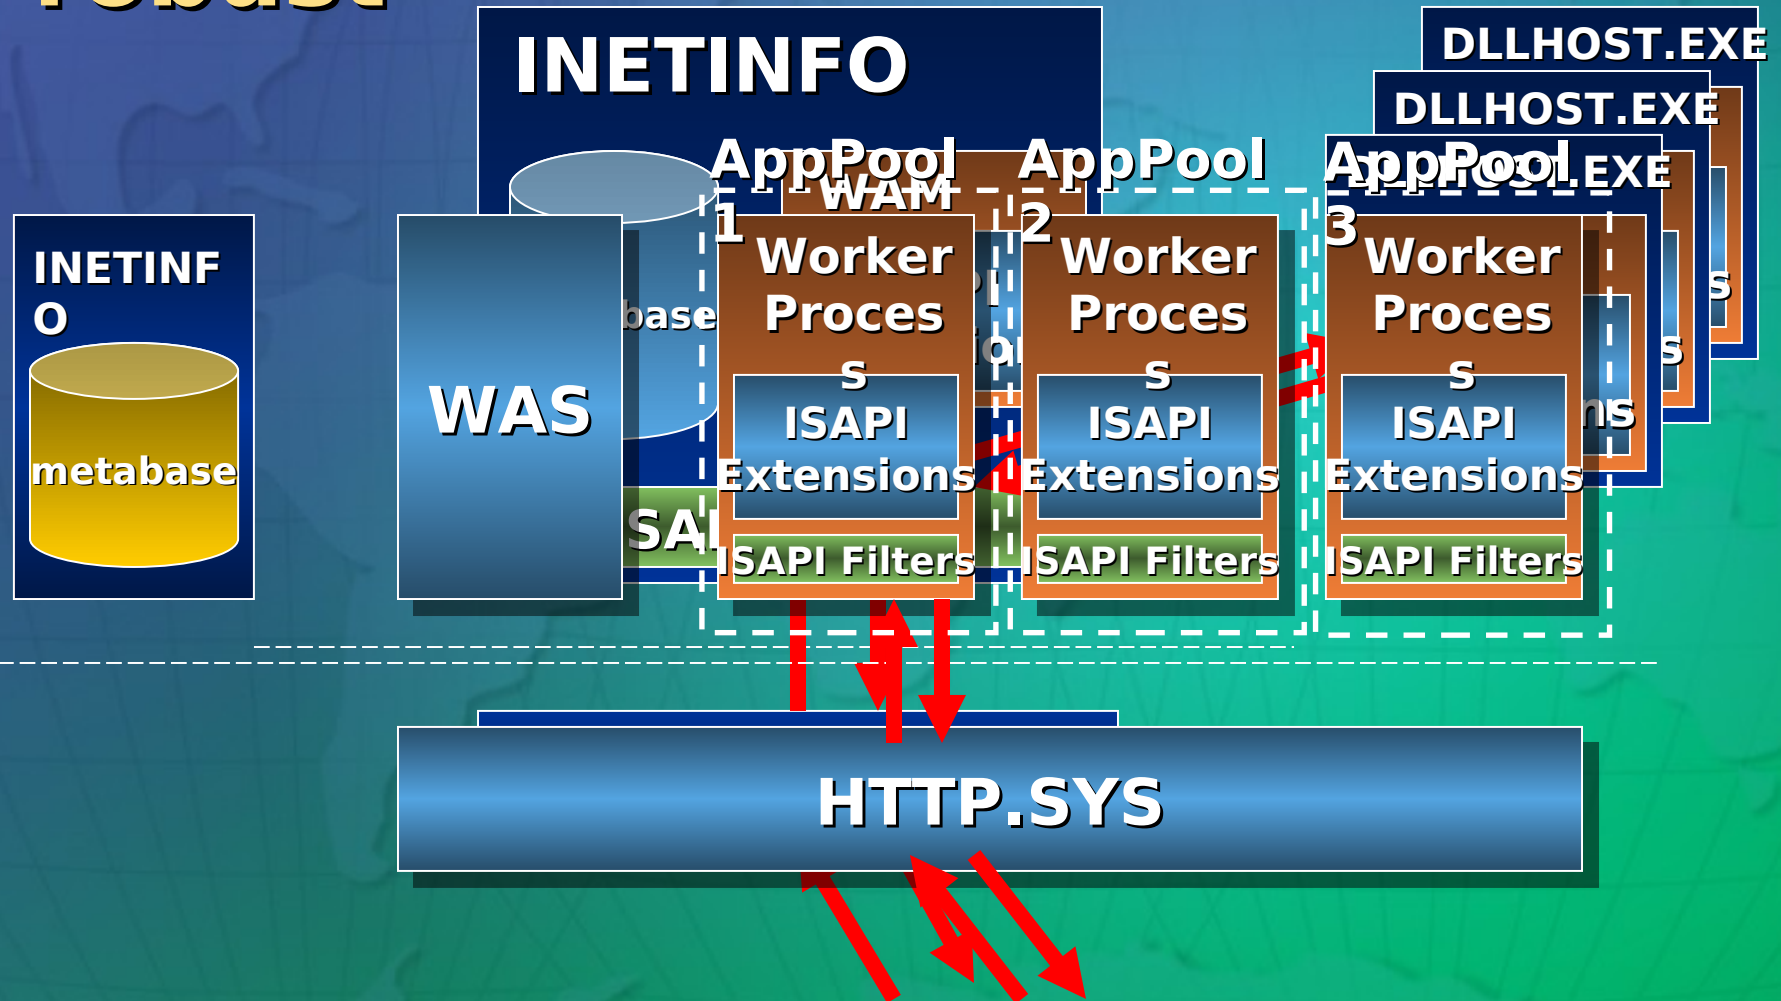

## **Web Processing Core -**

### **W3WP.exe**

- **What is it?**
  - **Main web processing core responsible for handling web requests**
- **Self-contained web server**
  - **Contains all web request processing functionality**
  - **Loads ISAPI's - filters and extensions**
    - **ASP, ASP .NET, FrontPage® Server Extensions**
- **Delivers complete isolation from system components and other**

# Rearchitecting IIS

IIS5 to IIS6 - Making it more robust

# Application Pools

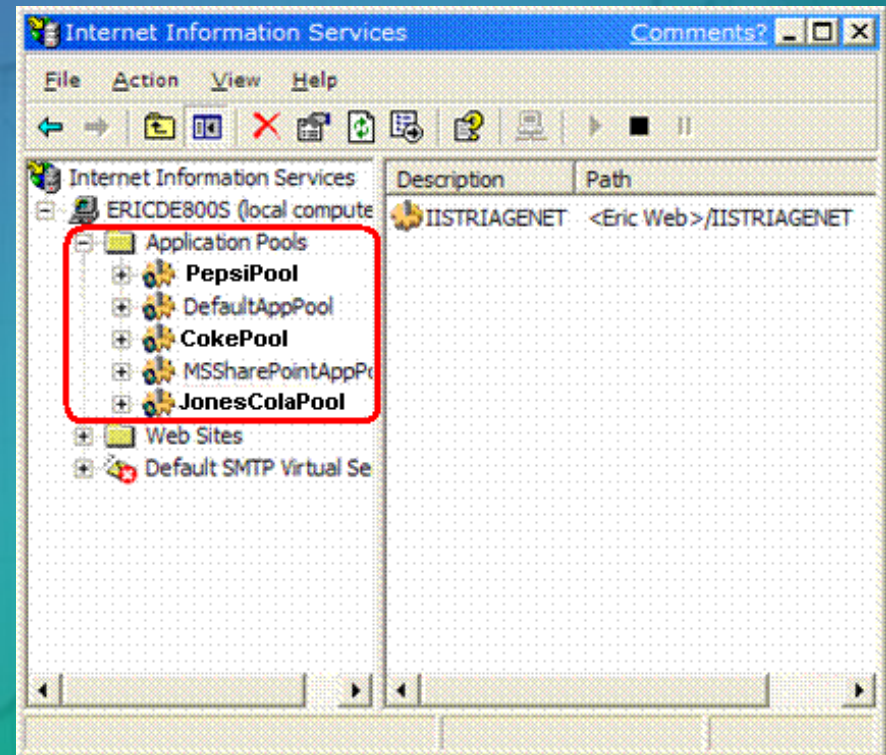

## Application Isolation in Processes

- **Can create 1 or more application pools**

- Each served by 1 or more processes.
- Each worker process serves only 1 pool.
- Reqs routed directly to pool by HTTP.sys

- **Isolate apps based on:**

- Site/Customer
- Functionality
- Reliability

# **Assigning Apps to App Pools**

## **demo**

**Jeff Kercher  
Program Manager  
IIS 6  
Microsoft Corporation**

# Application Pooling

## Configurable Worker Process ID

- **Worker process can be started as:**
  - **Network Service (default)**
  - **Local System**
  - **Local Service**
  - **Configured ID**
- **IIS\_WPG**
- **Details - Attend AWS306**

The screenshot shows the 'TRIAGEPOOL Properties' dialog box with the 'Identity' tab selected. The 'Application Pool Identity' section is visible, showing the 'Configurable' radio button selected. The 'User name' field contains 'IWAM\_ERICDE800S' and the 'Password' field is masked with dots. A 'Browse' button is next to the 'User name' field. The dialog box has tabs for 'Recycling', 'Performance', 'Health', 'Debugging', 'Identity', 'Cache Options', and 'Process Options'. The 'Identity' tab is currently active.

# Application Pooling

## Web Gardens and Processor Affinitization

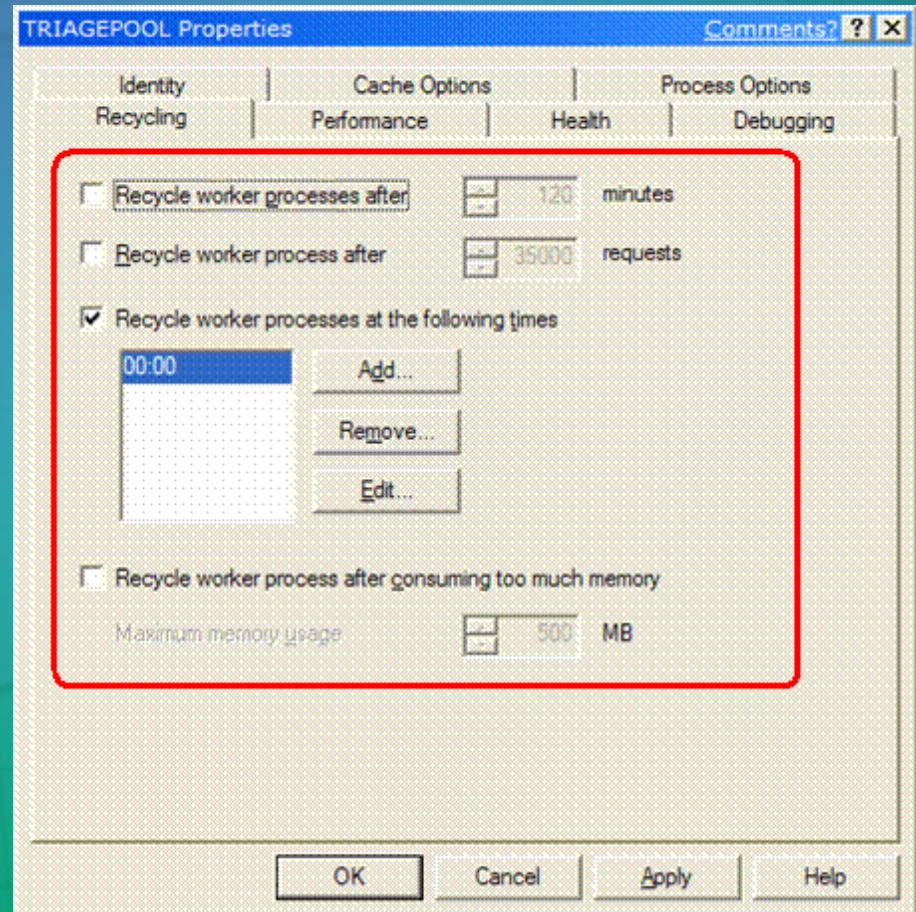

- **Web Gardens**
  - App Pool w/ > 1 worker process
  - Primarily reliability feature
  - Connection-based routing w/in Garden
- **Processor Affinitization**
  - Bind app pool process/es to 1 or more CPU's

# Recycling

## What is it and Why use it?

- **What is it?**
  - Periodically restart applications based on:
    - Uptime
    - # of requests
    - Scheduled time
    - Memory consumption
    - On-demand
- **Why use it?**
  - Refresh apps to ensure availability
  - Prevent bad apps from taking over the system

# Recycling

## Overlapping vs. Non-Overlapping

### Overlapping Recycle

- Only terminates old process after new process starts
- Possible for apps to be instantiated multiple times

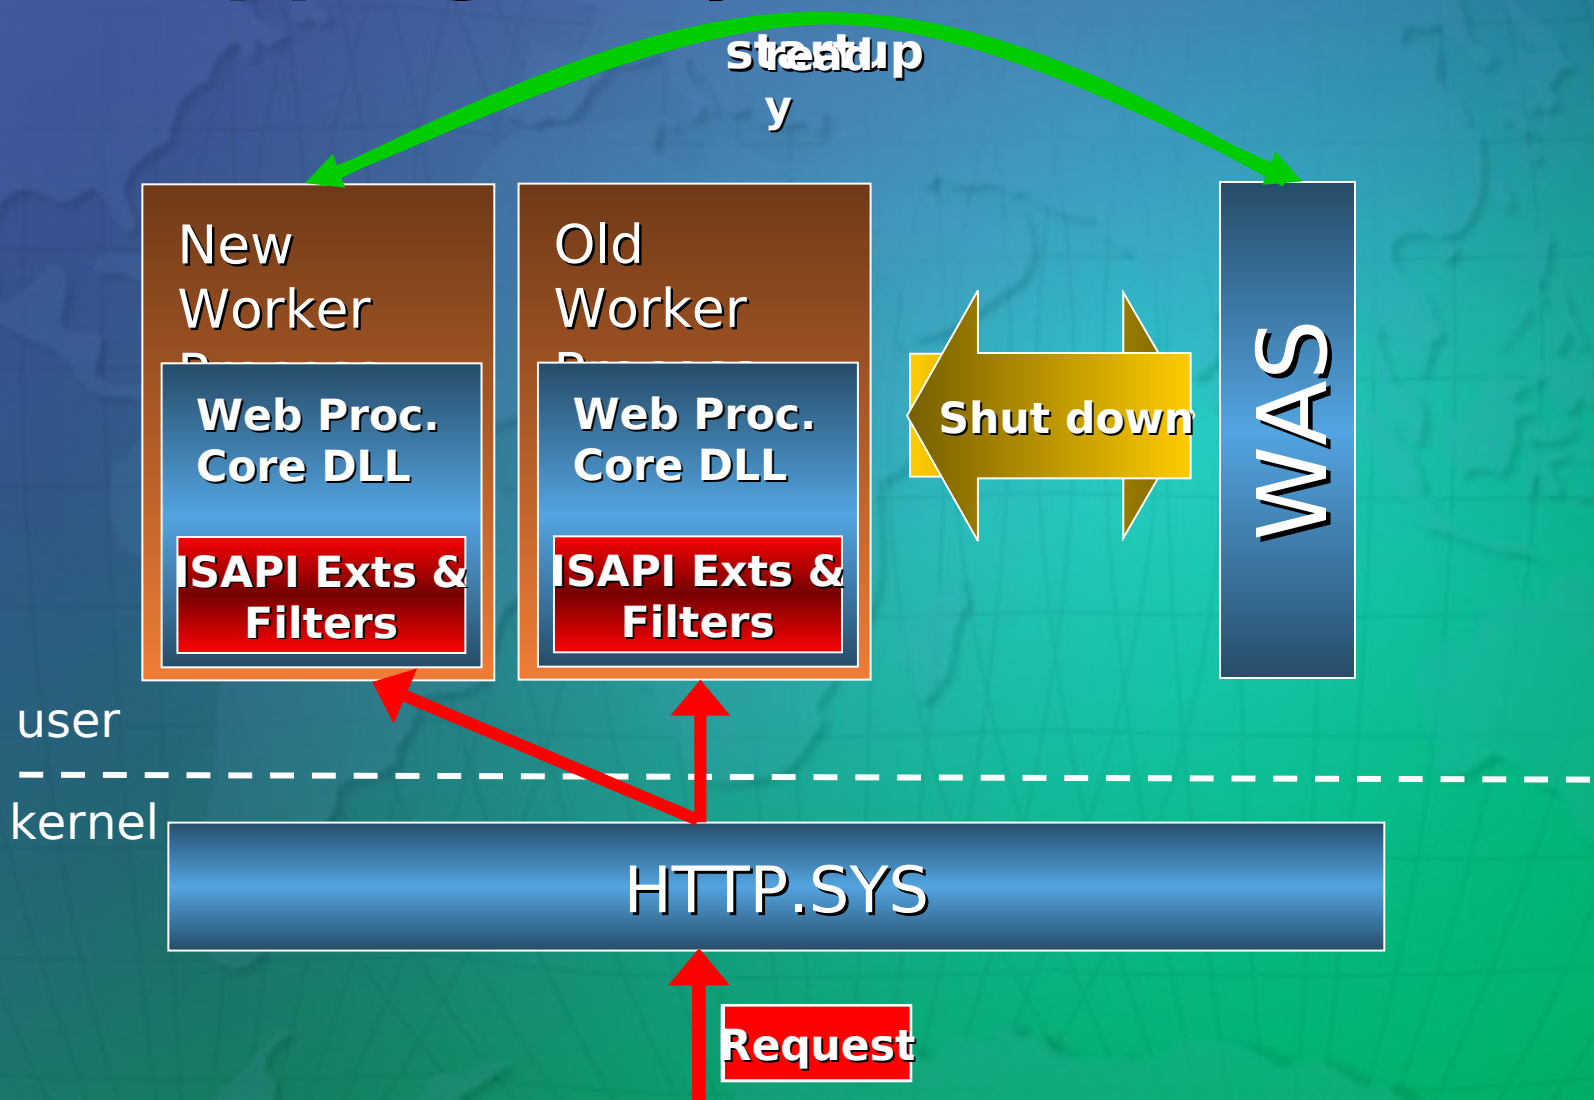

### Non-Overlapping Recycle

- Terminates old process first
  - *Then* starts new process to replace it
  - Reduces multi-instance problems
- BOTH still queue requests in the kernel - No interruption in service!

# Recycling

## Overlapping Recycle

# **Recycling a worker process**

## **demo**

**Jeff Kercher  
Program Manager  
IIS 6  
Microsoft Corporation**

# Recycling

## ISAPI Interaction - REPORT\_UNHEALTHY

- **HSE\_REQ\_REPORT\_UNHEALTHY**

- Goal: allow an ISAPI to report to IIS that it needs to be recycled.

```
bResult = pECB-> ServerSupportFunction(  
                                                pECB->ConnID,  
                                                HSE_REQ_REPORT_UNHEALTHY,  
                                                psz_reason_unhealthy,  
                                                NULL,  
                                                NULL  
                                                );
```

- **ASP Hang Detection**
  - Used to detect when ASP threads block in components

# **ISAPI Report\_Unhealthy**

## **demo**

# Health Detection

## Crash Detection & Rapid Fail Protection

- WAS detects process crash/AV's
- On failure
  - Publish event to event log
  - Check "crash count"
  - If (Crash count > Max Crashes in time limit)
    - Disable app pool
  - Else start new process if demand
- Rapid Fail Protection
  - Only allow x crashes in y minutes
  - Publish event to event log

The screenshot shows the 'TRIAGEPOOL Properties' dialog box with the 'Health' tab selected. The 'Enable Ping' checkbox is unchecked, and the 'Ping worker process every' is set to 120 seconds. The 'Enable Rapid Fail Protection' checkbox is checked and highlighted with a red rectangle. Below it, the 'Crashes' value is set to 5 and the 'Time period' is set to 10 minutes. The 'Startup Time Limit' is set to 30 seconds, and the 'Shutdown Time Limit' is set to 60 seconds. The 'OK', 'Cancel', 'Apply', and 'Help' buttons are at the bottom.

Property	Value	Unit
Enable Ping	<input type="checkbox"/>	
Ping worker process every	120	seconds
Enable Rapid Fail Protection	<input checked="" type="checkbox"/>	
Crashes	5	
Time period	10	minutes
Startup Time Limit	30	seconds
Shutdown Time Limit	60	seconds

# **Rapid Fail Protection**

## **demo**

**Jeff Kercher  
Program Manager  
IIS 6  
Microsoft Corporation**

# Health Detection

## Pinging

- **What is it?**
  - Designed to detect worker process thread deadlock
  - Will engage if there are no threads in worker process available to respond in time
- **How does it work?**
  - WAS will “ping” each worker process
  - Process has a configured time limit to respond
  - If (no response in time limit)
    - Default: kill process, publish event, and start new process

# **Health Detection**

## **Configurable Debug Action**

- **Allows for custom action to be executed when process fails to respond - Examples:**
  - **Send email to admin**
  - **Attach debugger**
  - **Take process dump**
- **Process left running**
  - **Though WAS dropped its process handle**

# **Enabling Debug Action**

## **demo**

**Jeff Kercher  
Program Manager  
IIS 6  
Microsoft Corporation**

# **Application Tips**

## **Considerations**

- **Make apps multi-instance aware**
  - **No single locks, etc.**
  - **Allows use of overlapping recycle, etc.**
- **Persist state externally**
  - **Recycled apps will lose state if persisted internal to host process**
- **Isolate new apps in “debug pools”**
  - **RFP turned on**

# **Application Tips**

## **ASP .NET Considerations**

- **ASP .NET will use the IIS6 process model when running in W3WP.exe**
  - **Runs completely within W3WP.exe**
  - **Takes advantage of complete process isolation and added health/reliability features**
  - **Uses IIS 6 process model settings instead of machine.config settings**
- **Use ASP .NET's external session state service**
  - **Persist state through a recycle**

# Summary

- **IIS6 is more reliable because it:**
  - Isolates apps from system components like WAS and HTTP.SYS
  - Isolates apps from one another via Application Pools
- **Application Pools introduce new features to further improve reliability:**
  - Periodic process recycling
  - Worker process health monitoring
- **.NET web apps and services are more reliable on IIS6**
  - IIS6 offers complete process isolation
  - ASP .NET plugs into new IIS6 features such as REPORT\_UNHEALTHY to further improve reliability
